Van Framework naar Platform

Korte herhaling

- Angular projects – meerdere stappen
  1. Set up environment, boilerplate & libraries
  2. Angular Root Component voor de app
  3. Angular Module @ngModule()
  4. Bootstrap component
  5. Write HTML-pagina (`index.html`)
- Daarna: vooral werken met Componenten en Services.
- Bijna nooit meer nodig nog naar kapstokcode om te kijken.

Data binding - Declarative syntax

- Four kinds of data binding in Angular. Use them in the template
  1. Simple data binding met {{ … }}
  2. Event binding (…)
  3. One-way data binding […]
  4. Two-way data binding [(…)]

Event binding syntax

Gebruik ronde haken voor events:

Angular 1:

```
<div ng-click="handleClick()">…</div>
```

Angular 2:

```
<div (click)="handleClick()">…</div>

<input (blur)="onBlur()">
```

Attribute binding syntax

Bind directly to properties of HTML-elements.
Also: *one-way binding.*
Use square brackets notation

Angular 1:

```
<div ng-hide="true|false">…</div>
```

Angular 2:

```
<div [hidden]="true">…</div>
```

Of :

```
<div [hidden]="person.hasEmail">…</div>
<div [style.background-color]="'yellow'">…</div>
```

Two way binding syntax

Update DOM and controller/class at the same time

Angular 1:

```
<input ng-model="person.firstName" />
```

Angular 2: de notatie is een beetje bizar:

```
<input [(ngModel)]="person.firstName" />
```

Components only

Hook	Purpose
ngAfterContentInit	After Angular projects external content into its view.
ngAfterContentChecked	After Angular checks the bindings of the external content that it projected into its view.
ngAfterViewInit	After Angular creates the component's view(s).
ngAfterViewChecked	After Angular checks the bindings of the component's view(s).

Angular does not call the hook methods in this order.

Angular vs. React vs. Vue: A 2017 comparison

Deciding on a JavaScript framework for your web application can be overwhelming. Angular and React are very popular these days, and there is an upstart which has been getting a lot of traction lately: VueJS. What's more, these are just a few of the new kids on the block.

STYLE GUIDE

Angular 2 for TypeScript

Write Angular 2 with style.

Welcome to the Angular 2 Style Guide

Purpose

If you are looking for an opinionated style guide for syntax, conventions, and structuring Angular applications, then step right in.

The purpose of this style guide is to provide guidance on building Angular applications by showing the conventions we use and, more importantly, why we choose them.
